

GigLend

Undercollateralized microloans for gig workers backed by on-chain income history

The Problem & Our Solution

Gig workers get paid in stablecoins but have no way to turn that income into credit for loans.

- Drivers, freelancers, and creators lack credit history and collateral for loans.
- Traditional finance and most DeFi lending both exclude them entirely.
- GigLend turns verified stablecoin payment history into an on-chain reputation score.
- Workers borrow small working-capital loans against that score, no collateral needed.
- Lenders deposit USDC into a pooled vault and earn yield funding these loans.

How It Works

From verified income data to an on-chain credit score to instant micro-loans, all on Solana.

- Worker connects wallet; stablecoin payment history is aggregated and verified on-chain.
- A credit score contract scores payment frequency and consistency over time.
- Lenders deposit USDC into a pooled vault that funds loans and earns yield.
- Borrower dashboard lets workers request a micro-loan sized to their score.
- Repayments and defaults adjust the score on-chain, with Pyth pricing USDC flows.

Pyth (price feeds), PostgreSQL indexer

Why Now & What's Next

Stablecoin payouts for gig work are exploding, but no credit layer exists yet to unlock capital.

- Gig work and stablecoin payroll are converging fast, with no credit infrastructure built for it.
- Next: integrate real gig platform payout APIs for stronger, verified income data.
- Next: build a more robust credit model using historical loan repayment performance.
- Next: pursue partnerships with gig platforms to offer embedded lending directly.
